Sketch the graph of a function f that is continuous on [1, 5] and has the given properties.

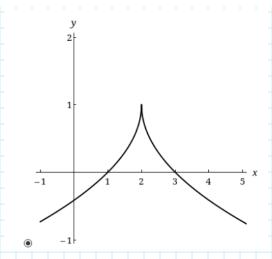

Absolute maximum at 5, absolute minimum at 2, local maximum at 3, local minima at 2 and 4

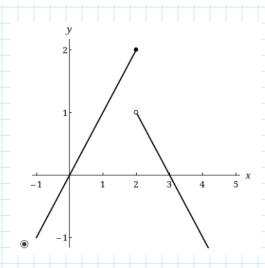

(a) Sketch the graph of a function that has a local maximum at 2 and is differentiable at 2.

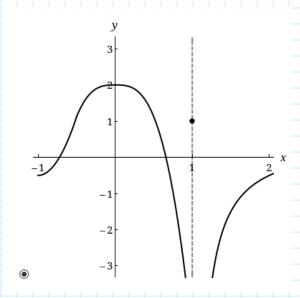

(b) Sketch the graph of a function that has a local maximum at 2 and is continuous but not differentiable at 2.

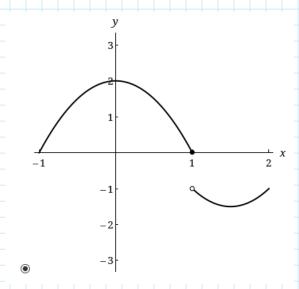

(c) Sketch the graph of a function that has a local maximum at 2 and is not continuous at 2.

(a) Sketch the graph of a function on [-1, 2] that has an absolute maximum but no absolute minimum.

(b) Sketch the graph of a function on [-1, 2] that is discontinuous but has both an absolute maximum and an absolute minimum.

Sketch the graph of f by hand and use your sketch to find the absolute and local maximum and minimum values of f. (Enter your answers as a comma-separated list. If an answer does not exist, enter DNE.)

Find the critical numbers of the function. (Enter your answers as a comma-separated list. If an answer does not exist, enter DNE.)

critical numbers of a function

are where slope = 0 or undefined

$$f(x) = 4 + \frac{1}{3}x - \frac{1}{2}x^2$$

$$x = \boxed{\frac{1}{3}}$$

$$f(x) = 4 + \frac{1}{3}x - \frac{1}{2}x^{2}$$

$$m = f'(x)$$

$$f'(x) = \frac{d}{dx} \left( 4 + \frac{1}{3}x - \frac{1}{2}x^2 \right)$$

$$= 0 + \frac{1}{3} - (2) \frac{1}{2} \times$$

$$f'(x) = \frac{1}{3} - x$$

After the consumption of an alcoholic beverage, the concentration of alcohol in the bloodstream (blood alcohol concentration, or BAC) surges as the alcohol is absorbed, followed by a gradual decline as the alcohol is metabolized. The function

$$C(t) = 1.35te^{-2.802t}$$
 †

models the average BAC, measured in mg/mL, of a group of eight male subjects t hours after rapid consumption of 15 mL of ethanol (corresponding to one alcoholic drink). What is the maximum average BAC during the first 2 hours? (Round your answer to three decimal places.)

0.177 wg/mL

When does it occur? (Round your answer to two decimal places.)
